ARKADELPHIA, Ark. -- Dr. Jess Kelly, assistant professor of biology at Ouachita Baptist University, made a recent presentation to the Arkansas Academy of Science, making public Ouachita's discovery in Clark County of the American Burying Beetle, *Nicrophorus americanus*, a rare insect bordering on global extinction.

Four Ouachita students also attended the meeting held at Harding University, including Tyler Files, whose work was honored in the annual undergraduate student research poster competition.

Files, a senior biology major from Arkadelphia, Ark., said his research topic was "Sarcophageous Insect Associations and Succession on Pig Carrion in Central Arkansas." He said he and Brienne Baley, a senior biology major from Dripping Springs, Texas, worked with Dr. Kelly to research and prepare the poster.

"This was my fourth time to present the poster," Files noted. "I presented at the Arkansas Capitol and at two INBRE conferences."

The beetle discovery happened by chance when Dr. Kelly, along with his students who were part of the J. D. Patterson Student Research Grant program, conducted a forensic study by placing pig carcasses in designated areas last summer. When the researchers checked their project, they found that the carcasses had attracted three American Burying Beetles.

Affirming his interest in the research project, Files said, "I plan to get a master's degree in wildlife or conservation biology and work with endangered animals. Dr. Kelly is a great professor to work with and I felt like I could use the knowledge that I learned about the decomposition process and incorporate it into a future job pertaining to a career in conservation biology."

Detailing information about their discovery, Dr. Kelly said there are three known natural populations of the American Burying Beetle in the world, one in northern Arkansas and Oklahoma, one in Nebraska and one in Massachusetts. "In the 1800s, this beetle was all across the United States," he said. "But when the passenger pigeon went into extinction about 1900, the beetle began to die as well. We can see that that was one of their primary foods. It had to adapt to new food sources.

"This is the first time this has ever been seen anywhere in southern Arkansas since probably 1890, so this is a major find for us." Kelly added. "We are especially thankful to the Ross Foundation for allowing us access to some of their lands for this project."

The researchers reported their discovery to U.S. Fish and Wildlife Services, which monitors and administers the endangered species program. They confirmed the beetles' identity and that there was no previous knowledge of the beetle in the area.

Because the beetle is an endangered species, the research program will need to receive a federal permit in order to continue research with the species. "This could potentially open the doors for many years of exciting research for Ouachita students in the future," Kelly said. "The dream would be for us to receive a permit in order to help monitor the existing community of the American Burying Beetle and potentially bolster the species back into full existence in the state of Arkansas."

In addition to Files, other Ouachita students attending the conference included: Jessica Ashcraft, a sophomore biology and psychology major from White Hall, Ark.; Sarah Bishop, a senior chemistry and biology major from Paron, Ark.; and Alyssa Stubblefield, a freshman biology major from Plano, Texas.
